A box for housing breathing masks in a passenger aircraft has a housing closed by a door and a pipe in the housing for delivering respiratory gas under a first pressure to the masks via a flexible line. In rest condition a catch holds the door in closed position. It may be disabled for providing access to the masks. A command, electrical or in the form of a second pneumatic pressure in the pipe, limits the opening of the box to a partially-open position preventing the masks from falling out upon release of the latch
